Paper 4 Alternative to Coursework

February/March 2024

1 hour 30 minutes

You must answer on the question paper.

You will need: Insert (enclosed)

Ruler

Calculator Protractor

INSTRUCTIONS

- Answer all questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do not write on any bar codes.
- If additional space is needed, you should use the lined pages at the end of this booklet; the question number or numbers must be clearly shown.

INFORMATION

- The total mark for this paper is 60.
- The number of marks for each question or part question is shown in brackets [].
- The insert contains additional resources referred to in the questions.

MEDCs – More Economically Developed Countries LEDCs – Less Economically Developed Countries

This document has 20 pages. Any blank pages are indicated.

1 Students did fieldwork on a local coastline. They investigated a variety of topics including longshore drift and coastal management.

The students agreed to test the following hypotheses:

Hypothesis 1: Longshore drift is occurring along the local coastline.

Hypothesis 2: Coastal defences have a positive impact on the local coastline.

(a) The students had learnt that longshore drift moves beach material along the coast. This is shown in Fig. 1.1 (Insert).

Which **three** of the following statements about longshore drift are correct? Tick (\checkmark) your answers.

statement	tick (✓)
Longshore drift occurs in deep water.	
Swash moves material down the beach.	
Movement of material up and down the beach is repeated with each wave.	
Waves approach the coastline at an angle.	
Backwash moves material up the beach.	
The direction of longshore drift depends on the direction of the tide.	
The prevailing wind influences the direction of longshore drift movement.	

[3]

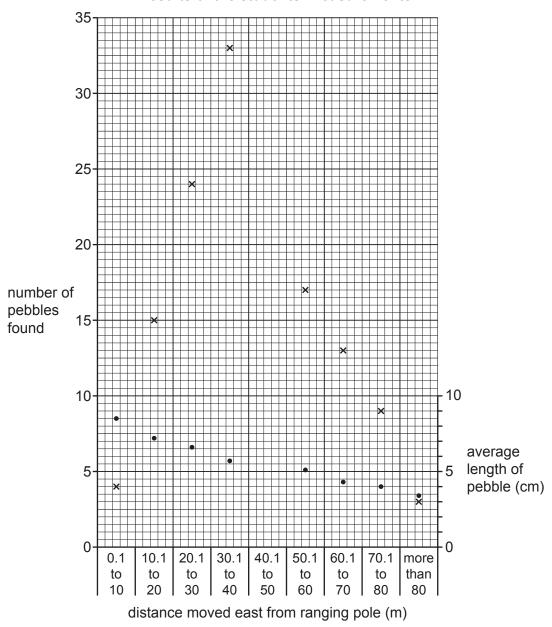

(b)	To investigate Hypothesis	1: Longshore	drift is	occurring	along	the	local	coastline,	some
	students used the fieldwork	method descri	bed in I	Fig. 1.2 (In	sert).				

(i)	Suggest why the students
	painted the pebbles
	repeated their method three times.
	[2]

(ii) The results of the students' measurements are shown in Table 1.1 (Insert).

Plot the results of the total number of pebbles found and the average length of pebble that moved between 40.1 m and 50 m from the ranging pole on Fig. 1.3. [2]

Results of the students' measurements

Key

- × total number of pebbles found in the three tests
- average length of long axis of pebbles (cm)

Fig. 1.3

	(iii) Do the results shown in Fig. 1.3 and Table 1.1 support Hypothesis 1: Longshore drift is occurring along the local coastline? Use data to support your conclusion.
	[4]
(c)	Other students used a different method to investigate longshore drift. Their method is described in Fig. 1.4 (Insert).
	Suggest two reasons why this method might produce unreliable results.
	1
	2
	[2]
(d)	In an area further along the coast the students saw some groynes such as the ones shown in Fig. 1.5 (Insert).
	Describe the groynes and explain how they can reduce the effect of longshore drift.
	[3]

- (e) To investigate **Hypothesis 2:** Coastal defences have a positive impact on the local coastline, the students did a bi-polar survey of four types of defences built along the coastline. Groynes are shown in Fig. 1.5 (Insert), gabions are shown in Fig. 1.6 (Insert), revetments are shown in Fig. 1.7 (Insert) and a sea wall is shown in Fig. 1.8 (Insert).
 - (i) The students filled in a bi-polar survey recording form as they looked at each type of defence. This is shown in Fig. 1.9 (Insert).

Suggest three	ways of	collecting	the	information	for	each	type	of	defence	that	would
help make the	results of	f the studei	nts' b	i-polar surv	ey r	nore r	eliabl	e.			

1	
••	[3]

(ii) The results of the bi-polar survey are shown in Table 1.2 (Insert). Figs. 1.10 to 1.13 show graphs of the results of the students' bi-polar survey.

Use these results to plot the score for 'attractiveness' and insert the total score for gabions on Fig. 1.10. [2]

Results of the students' bi-polar survey

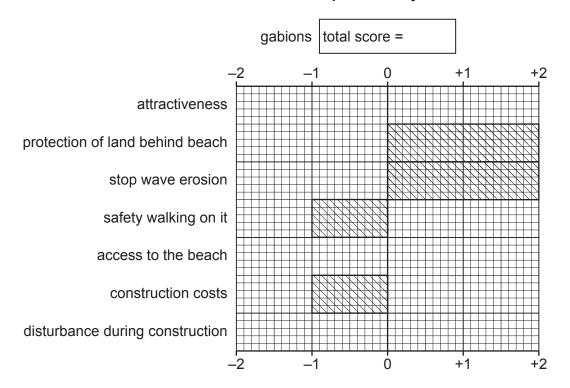

Fig. 1.10

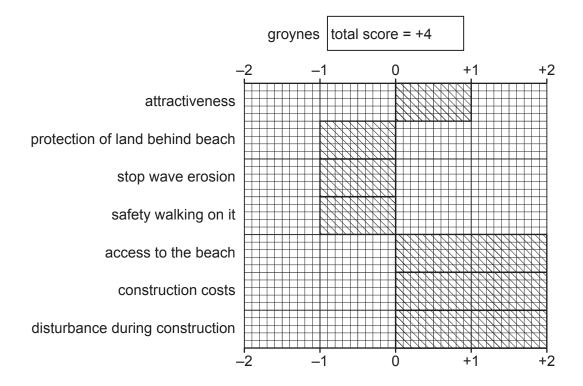

Fig. 1.11

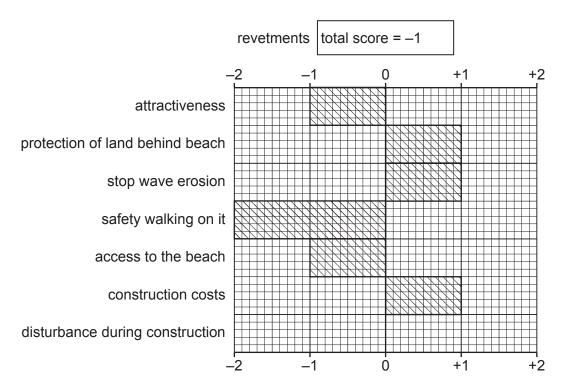

Fig. 1.12

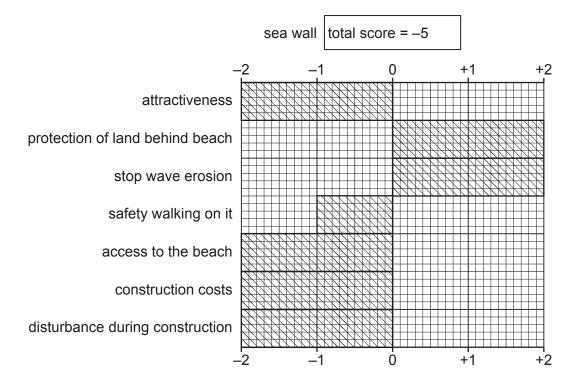

Fig. 1.13

(iii) Do the results of the fieldwork support **Hypothesis 2**: Coastal defences have a positive impact on the local coastline? Tick (✓) your conclusion. Support your conclusion with total scores from Figs. 1.10, 1.11, 1.12 and 1.13.

	tick (√)		
The conclusion is true for all defences.			
The conclusion is true for some defences.			
The conclusion is false for all defences.			
	1	1	
			[4]

(f) As an extension task the students counted the number of each different method used to protect the natural environment of the area from visitors. Their results are shown in Table 1.3 (Insert).

(i) Use the results to **plot the number of litter bins** on Fig. 1.14.

[1]

Methods used to protect the natural environment

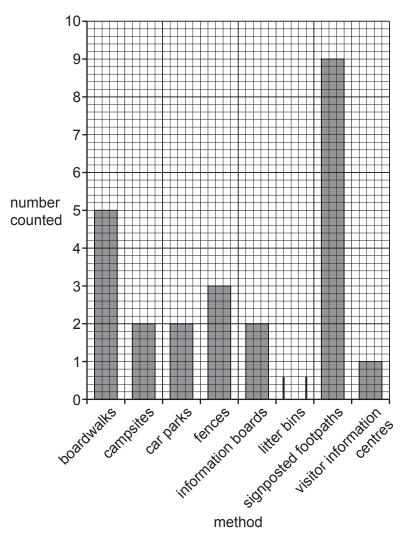

Fig. 1.14

(ii)	Describe different ways each of the following can be used to protect the natural environment from visitors.
	litter bins
	car parks
	signposted footpaths
	visitor information centres
	[4]

[Total: 30]

BLANK PAGE

2 Students in Scotland, UK, (an MEDC in Europe) visited a local manufacturing industry. The factory is located near to the centre of a large urban area. Two groups of workers are employed in the factory: one group develops new products and the other group makes the products from imported components.

The students did some fieldwork to investigate where the workers lived and to find out what were the main advantages and disadvantages of living there. One student used the results of their fieldwork to investigate the following hypotheses:

Hypothesis 1: The two groups of workers live in different parts of the urban area.

Hypothesis 2: Workers think that travelling to and from work is the main disadvantage of where they live.

(a)	(i)	To collect data to test these hypotheses the students produced a questionnaire. This	is
		shown in Fig. 2.1 (Insert).	

Name and describe a suitable method of selecting workers to complete the questionnaire to get a representative sample.

	Name of sampling method
	Description
	[3]
(ii)	Part of the recording sheet which the students used is shown in Fig. 2.2 (Insert). Describe this method of recording results.
	[2]

- **(b)** The results for question 1 in the questionnaire (*In which part of the urban area do you live?*) are shown in Table 2.1 (Insert).
 - (i) A student used these results to draw the maps shown in Figs. 2.3 and 2.4.

Use Table 2.1 to **complete Fig. 2.3** to show the number of workers who develop new products living in Almond and Forth. [2]

Where workers who develop new products live

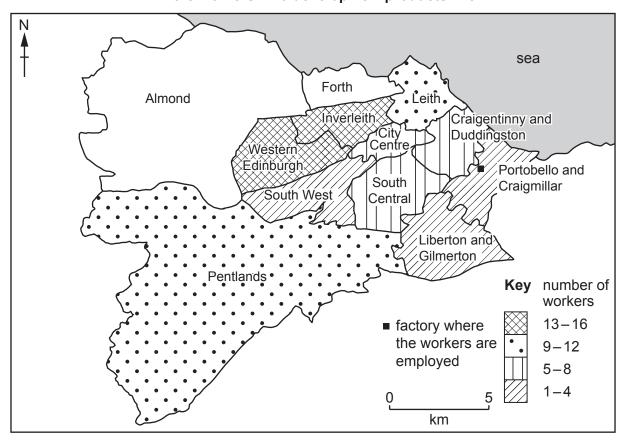

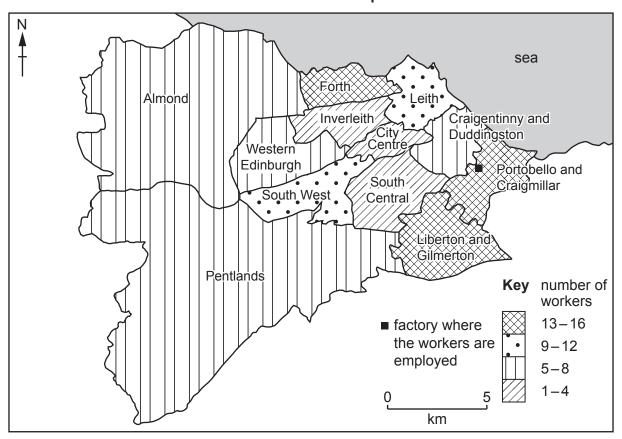

Fig. 2.3
Where workers who make the products live

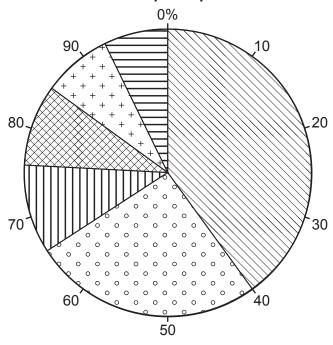

(ii) Name the type of map shown in Figs. 2.3 and 2.4. Choose from the following list. Tick (✓) your choice. [1]

	tick (√)
choropleth map	
flow line map	
isoline map	
relief map	

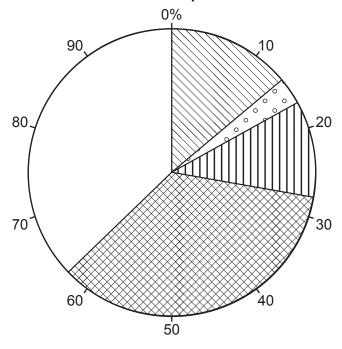

(iii)	Give two advantages of using this type of map to present data.					
	advantage 1					
	advantage 2					
		[2]				
(iv)	What conclusion did the student make about Hypothesis 1 : The two groups of workers live in different parts of the urban area?					
	Support your decision with data from Figs. 2.3 and 2.4 and Table 2.1.					
		[4]				

- (c) Table 2.2 (Insert) shows the results of Question 2 in the questionnaire, (What is the main advantage of living in your area?).
 - (i) Use the results from Table 2.2 to complete the graph for workers who make the products in Fig. 2.5. [2]

Advantages given by workers who develop new products

Advantages given by workers who make the products
